Presentation

The **National Institute of Statistics and Geography (INEGI)** do the **National Household Survey (ENH)** with the purpose of
have a continuous input that provides basic sociodemographic information on the population, as well as that referring to certain issues related to housing conditions and access to various goods and information technologies that Mexican households present.

In the document **Description of the database,** is provided
a guide to the various users with the necessary information for the analysis of the microdata.

Index

Introduction

The ENH 2017, carried out by the National Institute of Statistics and Geography (INEGI), was carried out continuously throughout the year seeking to obtain sociodemographic data about the members of the household, their occupation and education, as well as the characteristics of the home and household equipment.

This guide has been prepared as a consultation and support document that describes how the database of the National Household Survey 2017 is formed.

The content is organized in 2 chapters, which are described below.

The first offers a general overview of the characteristics of the database and its composition, followed by all those conceptual elements that allow a better understanding of the ENH 2017 database.

The second section presents the descriptions of the tables that make up the database, the attributes of the variables contained in them, as well as the code catalogs for the values   that make up the ENH 2017 microdata.

1. Characteristics of the ENH 2017 database

1.1 Conformation of the database

The database of the National Household Survey is made up of three tables of normalized data, information obtained from the survey according
(*all non-key attributes of a relation depend solely and exclusively on the key)* in which the
to the topics most used for analysis and tabulation.

1.1.1 Tables (data files)

The tables that make up the database contain information associated with three levels or groups, one associated with the home, another associated with the household, and the last associated with the household member. The tables for each level and the information they contain are listed below.

Table with housing information

HOUSING - Contains the characteristics of the dwellings that were captured in Section A of the BASIC QUESTIONNAIRE, as well as the count of the residents and households of the dwelling captured in Section B, the location and the corresponding sample design.

Table with household information

HOME - Integrates with information about guests and domestic workers of the home.

Table with people information

PERSON - Contains sociodemographic, occupational and health condition characteristics of the household members. This information is captured in Sections C, D and E of the BASIC QUESTIONNAIRE.

1.1.2 Units of analysis

The units of analysis for ENH are the dwelling, the household and the members of the household; In order to make a correct exploitation of the database, the relationships between the tables must be considered according to their key fields. The description of these fields is as follows:

Folioviv (House Identifier)

It consists of 10 digits: two digits with the code of the federative entity, one with the area (urban, code other than 6; rural, code 6), four digits of the consecutive number of the upm and three digits with a consecutive number for the selected home.

Foliohog (Household Identifier)

Digit to identify the number of households in the dwelling: 1 is assigned when there is only one household in the dwelling; When several households are detected, in the household questionnaire that was initially attended to, 1 is noted (main household) and in the questionnaires of the other households in the dwelling, it is assigned from 2 to 5 depending on the number of households.

Id_pobla (Identifier of the person)

It is the unique identification number for each member of the household (it is the number of the line of the questionnaire in which the information was collected).

1.1.3 Expansion factor

One of the distinctive characteristics of probabilistic household surveys is that the selected households and the people who reside in them represent other households and people of similar socioeconomic conditions. The expansion factor constitutes the weight that is given to each sample unit to generalize the results of the sample to the population.

In the ENH 2017 the expansion factor for any level (dwelling, household or person) is found in the variable *factor* from the HOUSING table.

1.1.4 Relationship between tables

The information contained in the tables can be related to the information in another table or with that of several existing tables in the Database, this can be done once the key fields have been identified, and it is done through the records that meet the condition of having the same information in the key fields of the tables to be related.

To relate the information contained in the tables of the National Household Survey Database, it is necessary to identify whether the table contains information corresponding to the HOUSEHOLD or the MEMBER of the HOUSEHOLD. According to this criterion, the key fields are identified, and the records that meet the condition of having the same information in the key fields of the tables to be related are made to match.

The table with information related to HOUSEHOLDS is:

• *HOME.*

The table with information by HOUSEHOLD MEMBER (per person) is:

• *PERSON.*

The types of analysis that can be done based on the records are:

One by one.
One to many.

2. Content of the ENH 2017 database

This chapter presents the content of the National Household Survey database at different levels, from the description of the general content of each table to the meaning of each code present in the microdata of the National Household Survey. This chapter is made up of four sections described below.

In the first section the content of each table is described in a general way, the number of variables that compose it is specified, as well as the key variables that relate it to the other tables.

The second section presents the list of variables included in each table, with its corresponding label and the associated variable type.

The third section is integrated with the descriptions of the variables in each table. The description of each variable is presented in the form of a tab and contains: the number that the variable occupies in the table, the name of the variable and its label; the type of variable it is (numeric or character and its length) and the range of values it takes; its definition and the origin of the variable can be a variable that comes from a survey questionnaire or it can be a constructed variable; and the list of values that the variable takes, if applicable.

In the last section, the code catalogs are presented, which contain the description for each code that is presented in the values of the variables in the database. These are in the order in which the variables associated with them appear.

Note: in the digital version of this document, the sections of this chapter are linked to facilitate navigation within it. The titles in the table descriptions are linked to those in the variable lists and vice versa. The names of the variables are linked to their descriptions and these to the variable lists. The variables that have a catalog associated with the range will have a link to it.

Kind	N (2)	Questionnaire	Basic questionnaire
Rank	{0, ..., 99}	Section and / or section	Section D
Definition	How long the house has been built.	**Question number**	5
		Textual question	How many years ago was this house built?

Note: 0 Less than a year; 1 year ; 2… 98 Years; 99 More than 99; Null Don't know.

13 kitchen: Has kitchen

Kind	C (1)	Questionnaire	Basic questionnaire
Rank	{1,2}	Section and / or section	Section D
Definition	Room of the house ready to prepare or **Question number** heating food, although it also has other uses.		6
		Textual question	Does this house have a room for cooking?

Value	Label
1	Yes
2	No

14 cocina_dor: Use bedroom kitchen

Kind	C (1)	Questionnaire	Basic questionnaire
Rank	{1,2}	Section and / or section	Section D
Definition	Kitchen used regularly also for sleeping.	**Question number**	7
		Textual question	Do they also sleep in the room where they cook?

Value	Label
1	Yes
2	No

15 cuart_dorm: Bedroom rooms

Kind	N (2)	Questionnaire	Basic questionnaire
Rank		Section and / or section	Section D
Definition	Number of rooms in the house that are usually used for sleeping, although they also have other uses.	**Question number**	8
		Textual question	How many rooms are used for sleeping, not counting hallways?

16 num_cuarto: Number of rooms

Kind	N (2)	Questionnaire	Basic questionnaire
Rank		Section and / or section	Section D
Definition	Total number of rooms that the house has, regardless of its use.	Question number	9
		Textual question	How many rooms does this house have in total, counting the kitchen? (Do not count hallways or bathrooms)

17 disp_agua: Water availability

Kind	C (1)	Questionnaire	Basic questionnaire
Rank	{1, ..., 6}	Section and / or section	Section D
Definition	Ways to supply water to the home, whether it is available or not, with piped water from the public network.	Question number	10
